

**Appendix 2 to
“Effects and influencing factors of PBC: A network-analysis”**

IPSERA 2024 submission

Abstract

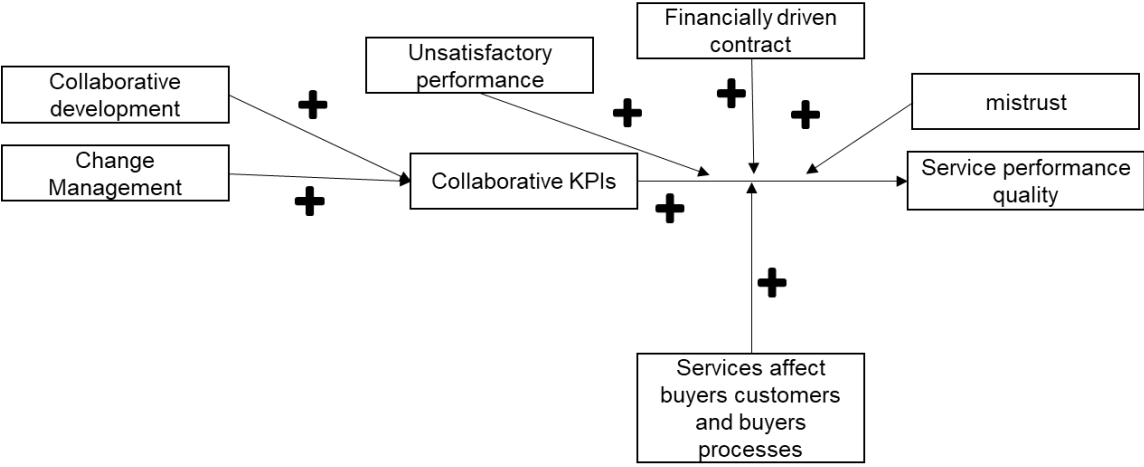

For procuring companies, incentives are essential for contract-based supplier management. One way to apply contract incentives is through Performance-based contracts (PBC). To successfully design and implement a PBC, procuring companies need to understand the cause-effect relationships of PBC constructs. This requires the identification of effects which result from PBC antecedents and success factors, especially financial and non-financial incentives, on suppliers' behaviour and PBC effectiveness. Therefore, this article aims to uncover the effect relationships by applying a network-analysis. The network-analysis is based on a systematic literature review and focuses on both, quantitative studies, as it is intended to study already researched effect relationships, and on qualitative studies to derive propositions. The review includes 77 contributions on PBC. Altogether, this work explicates antecedents, success factors, incentive types, and their effects on PBC effectiveness. The network analytical method visualises the effect relationships. Furthermore, the network-analysis distinguishes core constructs of PBC and how they interrelate, providing insights for procuring companies on contract design and implementation for supplier management.

Keywords: Performance-based Contracting, Literature review, Network-analysis, Effects

Table 4 – Findings on additional quantitative and qualitative effects of PBC

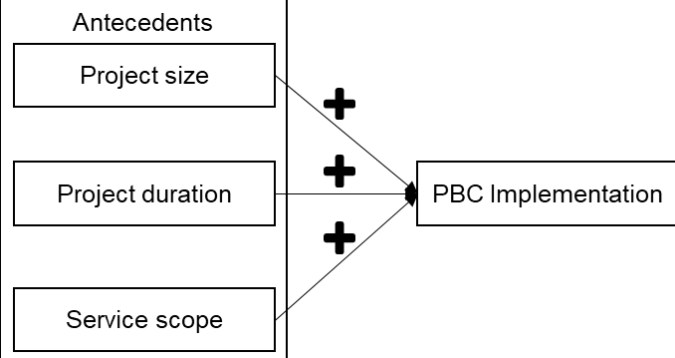

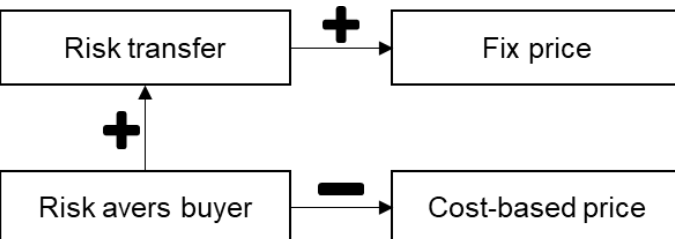

No	Reference	Propositions and graphical representations
1.	Akkermans et al. (2019)	<p>P1: Performance of an outsourced, co-produced service will be enhanced by the use of KPIs that measure and reward both supplier and customer (buying firm) performance. P2: The development of a collaborative KPI contracting approach, and thereby the performance of an outsourced, co-produced service, will be enhanced by the use of collaborative development and change management processes, involving representatives deeply familiar with the actual service operations and the interdependencies between the service processes at the supplier and the buyer. P3: The collaborative KPI contracting approach will have a positive effect on the performance of an outsourced, co-produced service, both when these services directly affect external customers of the buyer and when these services directly affect the primary processes of the buyer. P4: The collaborative KPI contracting approach will have a positive effect on the performance of an outsourced, co-produced, and complex service, both in the case of services with continuous delivery and in the case of discontinuous delivery. P5: The collaborative KPI contracting approach will have the biggest impact on performance when there is a financially driven contract, very low operational performance, and extensive mistrust on both sides.</p>  <pre> graph LR CD[Collaborative development] -- "+" --> CK[Collaborative KPIs] CM[Change Management] -- "+" --> CK UP[Unsatisfactory performance] -- "+" --> CK FDC[Financially driven contract] -- "+" --> CK SABC[Services affect buyers customers and buyers processes] -- "+" --> CK CK -- "+" --> SPQ[Service performance quality] FDC -- "+" --> SPQ UP -- "+" --> SPQ M[mistrust] -- "+" --> SPQ </pre>
2.	Alqahtani et al. (2023)	<p>Prolonged negotiation, poor incentives and KPIs, and freedom in the SOW can affect cost. Long contracts can help suppliers improve their products. Poor KPIs and incentives can affect suppliers' willingness to improve reliability. A lack of trust can lead to a reluctance to collaborate, which can in turn increase the cost.</p>

		<p>Failures to exchange information can consequently lead to hidden costs. Sharing information can help to achieve availability targets.</p>
3.	Alqahtani et al. (2023)	<p>Suppliers' involvement through collaboration and knowledge sharing is key to reducing cost. Failing to accurately forecast demand for spare parts can increase budget losses (i.e. cost). A limited number of available suppliers can lead to cost increases. Integrating sub-suppliers will affect availability since they have the ability to increase spare parts quality. Failure to accurately forecast demand for spare parts can negatively impact a weapon system's readiness, i.e. availability. Integrating sub-suppliers will affect reliability since they have the ability to increase spare parts quality.</p>

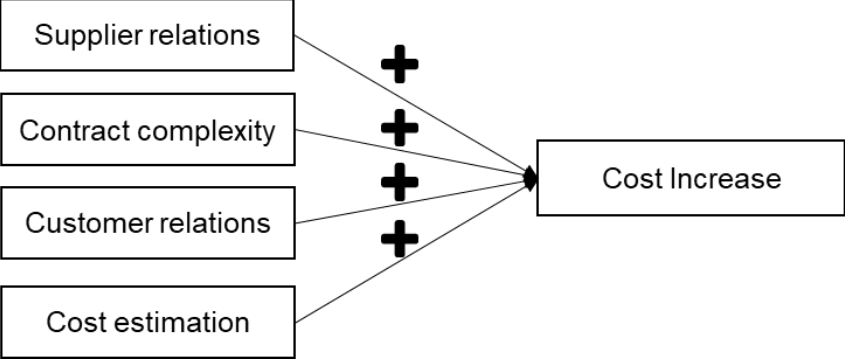

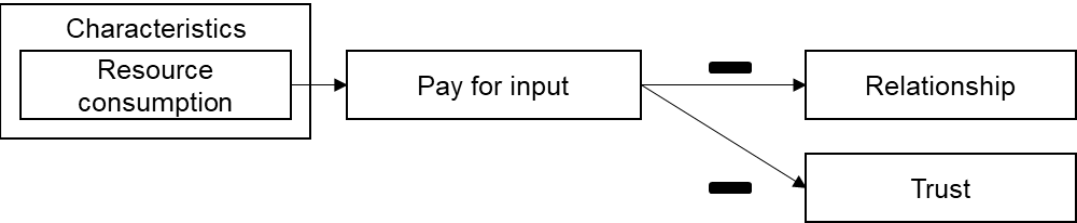

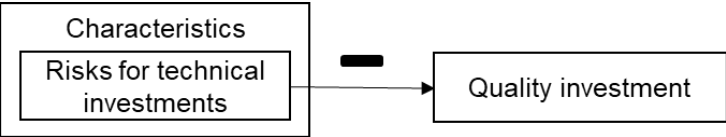

4.	Alqahtani et al. (2023)	<p>Through the use of best commercial maintenance practices, PBL is likely to improve the service and at a lower cost. Investing in technology reduces the risk of disruption, which results in better cost efficiency. Redesigning high-failure components can reduce the cost of spare parts. Improving the maintenance turnaround time will improve the availability of the weapon system. Investing in technology reduces the risk of disruption, which leads to a higher availability rate. Redesigning high-failure components can improve the readiness of a weapon system, i.e. availability. Increased repair capacity can lead to improved reliability. Investing in technology reduces the risk of disruption, which leads to a lower failure rate, i.e. better reliability. Improving the maintenance process can improve maintenance effectiveness.</p>

		<p>A causal diagram with the following nodes and relationships:</p> <ul style="list-style-type: none"> Quality investment (left) has a negative relationship (-) with Risk of disruption (middle). Product/process improvements (top middle) has positive relationships (+) with Cost reduction (top right), Reliability (middle right), Availability (bottom right), and Maintenance effectiveness (bottom right). Risk of disruption (middle) has positive relationships (+) with Reliability (middle right), Availability (bottom right), and Maintenance effectiveness (bottom right). Product redesign (bottom middle) has positive relationships (+) with Reliability (middle right), Availability (bottom right), and Maintenance effectiveness (bottom right).
5.	Alqahtani et al. (2023)	<p>Sudden changes in the defence environment affect the cost of operations negatively. Uncertainties as a result of war affect availability negatively. Different mindsets between a buyer and supplier can result in difficulties in transitioning to PBL and incur hidden costs. Culture clashes can hinder teamworking, which will affect reliability improvements. The defence procurement structure (having operational and commercial customers) can increase the time needed to draft a contract, which can in turn accumulate additional costs and affect a supplier's profit.</p> <p>A causal diagram with the following nodes and relationships:</p> <ul style="list-style-type: none"> Information/knowledge exchange (top left) has positive relationships (+) with Cost reduction (top right) and Availability (bottom right). Lack of Human resources (bottom left) has a negative relationship (-) with Availability (bottom right).

6.	Ates et al. (2023)	<p>PBC implementation leads to outcome control on CG, which translates into RG effects through the implementation of PBC control and the potential of advanced digital technologies to improve the effectiveness of both governance mechanisms.</p>  <pre> graph LR PBC[PBC Implementation] -- "+" --> CG[Contractual governance] PBC -- "+" --> RG[Relational governance] RG -- "+" --> CG RG -- "+" --> RG </pre>
7.	Anastasopoulos et al. (2009)	<p>The model results show that PBC prolongation is positively related to the original contract period and to the presence of certain maintenance activities - illumination repair and maintenance, shoulder repair and maintenance, mowing, and traffic signs and signals - in the work scope. The contract period, bridge-tunnel or rest area maintenance activities, and the number of activities incorporated in the PBC were found to decrease the probability that the PBC would not be prolonged.</p>  <pre> graph LR NMA[Nature of maintenance activities] -- "-" --> CRP[Contract renewal prospects] CL[Contract length] -- "+" --> CRP </pre>

8.	Anastasopoulos et al. (2009)	<p>We find that large projects with strong competition, long duration and extension periods, long outsourced road sections that incorporate crack sealing, pothole repair, illumination repair/maintenance, and mowing activities, favour outsourcing under PBC.</p>  <pre> graph LR subgraph Antecedents A1[Project size] A2[Project duration] A3[Service scope] end A1 -- "+" --> PBC[PBC Implementation] A2 -- "+" --> PBC A3 -- "+" --> PBC </pre>
9.	Bajari and Tadelis (2001)	<p>If the buyer is risk averse, then a compensation structure based on cost reimbursement should be avoided (fixed price is the greatest possible risk transfer).</p>  <pre> graph TD RA[Risk averse buyer] -- "+" --> RT[Risk transfer] RA -- "-" --> CBP[Cost-based price] RT -- "+" --> FP[Fix price] </pre>
10.	Batista et al. (2017)	<p>Proposition 1. Servitization through OBC requires a shift from a product-centric view of solutions to a relational-process view of solutions. Proposition 2. In servitization initiatives through OBC systems, variety arising from the customer organization is mainly an issue of internal variety, rather than variety originated from the external environment. Proposition 3. The development of purposeful relationships between the firm and the customer are critical to guarantee the viability of servitization initiatives through OBC. Proposition 4. Organizational boundary fuzziness is an inherent feature of OBC service systems, in which the operational, managerial and governance functions should be primarily determined by the systems' purpose and not limited by organizational boundaries.</p>

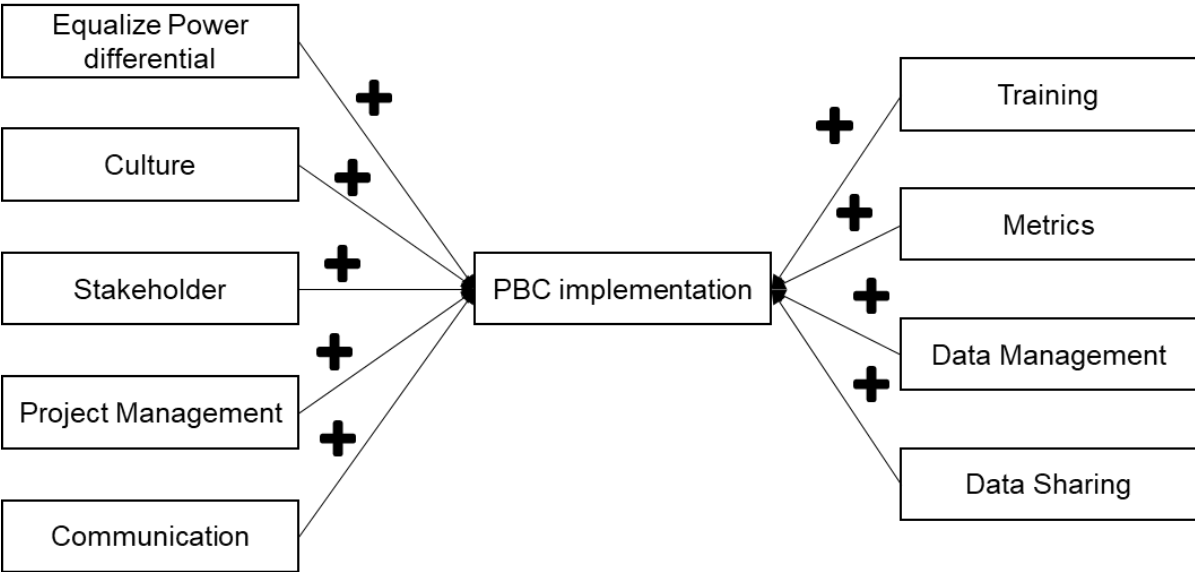

11.	Chansa et al. (2020)	<p>Suppliers can be held accountable for their performance, if a reward/penalty mechanism is defined, which is linked to the (non)performance.</p>
12.	Datta (2020)	<p>The major hidden cost drivers at different PBC stages are identified and their impacts on different service network partners are shown in Table 4. The performance loss resulting from the Prime's inability to align the wider supply base impacted the Prime and the suppliers more than the customer. Contract complexity and customer relationship management had severe impacts on the customer. Wrong estimates due to cost estimation problems impacted the suppliers severely. The supply base and Near Primes were largely unaffected by the Prime's customer relationship management abilities. These findings help to refine the framework developed in Section 2 of the paper based on agency theory (AT) and S-D logic.</p>

		
13.	Datta and Roy (2013)	<p>Since the suppliers are paid per unit basis for each extra unit of spare or manpower, the relationship or trust does not exist.</p> 
14.	Datta and Roy (2013)	<p>When the supplier takes all risks for making technical investments but since he has to bear the costs themselves, he will not invest in permanent facility just in short-term facility depending on the needed spare volume.</p> 
15.	Datta and Roy (2013)	<p>When the supplier is paid only for a fixed price amount he will reduce the technical capability and efforts to the minimum.</p>

		<pre> graph LR A[Fix price] -- "-" --> B[Technical capability] A -- "-" --> C[Effort level] </pre>
16.	Datta and Roy (2013)	<p>If a supplier is incurring heavy losses by taking all the risks, it will be very difficult to motivate them to deliver the quality of service specified by the buyer.</p> <pre> graph LR A[Supplier takes all risks] -- "+" --> B["(Heavy) losses"] B -- "-" --> C[Performance quality] </pre>
17.	Datta and Roy (2013)	<p>Under a 50:50 risk sharing mechanism, the supplier feels empowered and makes the best possible investments in technology and manpower to reduce costs for both parties (including transaction costs).</p> <pre> graph LR A[Risk allocation] -- "+" --> B[Quality investment] B -- "+" --> C["Motivational behaviour"] B -- "+" --> D["Product/process improvement"] B -- "+" --> E[Cost reduction] </pre>

61.	Lu (1999)	<p>Incentives in PBC can improve effort induced by the contract or change the suppliers reporting practice in three party service relationships (supplier, regulator and customer).</p>

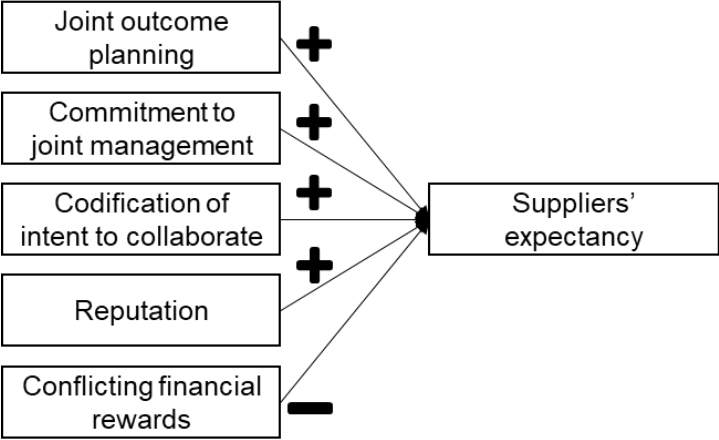

62.	Mechanic (2002)	<p>Incentives have profound influence on the implementation and effectiveness of internal measures intended to promote high quality of performance.</p>
63.	Mirzahosseiniian et al. (2016)	<p>The numerical example shows that the change in the operating fleet size significantly influences the supplier's profit margin and his decision on reliability, spares stock, and service capacity.</p>
64.	Ng et al. (2013)	<p>Our study shows that behavioral and information alignments are important to achieve outcomes. However, material and equipment alignment (i.e., joint supply chain) does not have a significant effect on contract performance. In addition, perceived control and empowerment mediated the relationship between partnership inputs and value-driven alignments.</p>

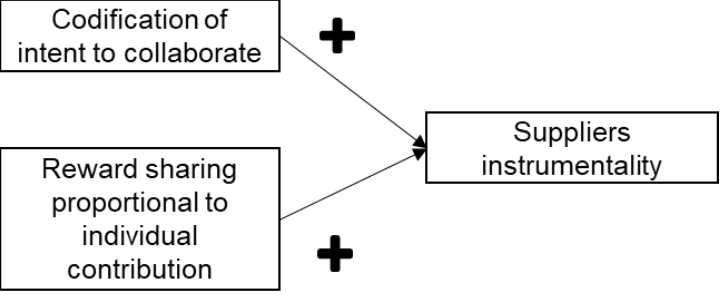

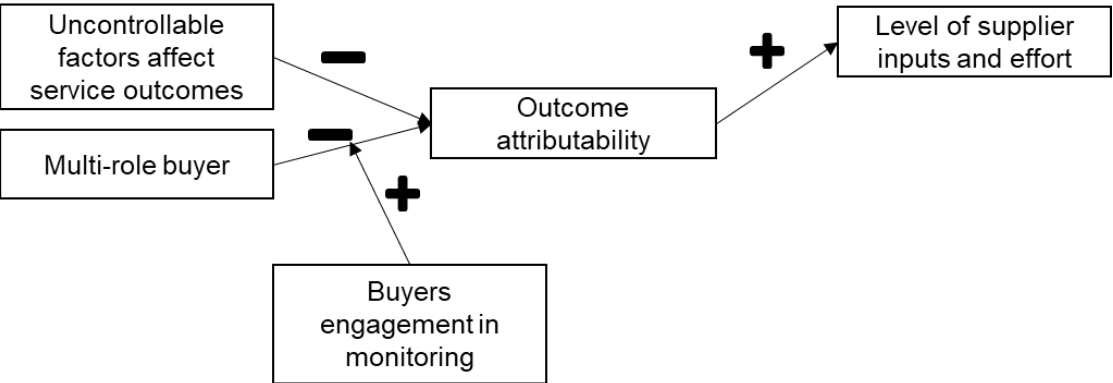

65. Ng and Nudurupati (2010)

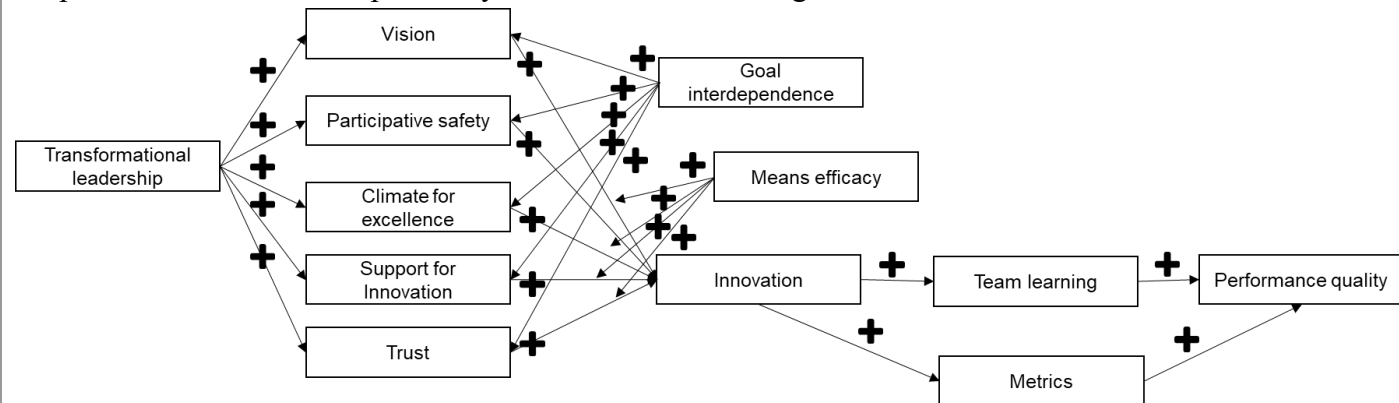

This study identified the challenges and risks of implementing OBCs, which include complexity and unpredictability of costs, dependability on customer in delivering the service and cultural change from traditional setting. Although the survey results revealed 11 factors that could mitigate these challenges and risks, the most important factors are mutual expectations, teamwork, shared information and materials as well as the firm's access to customer resources.

66.	Nikulina and Wynstra (2022)	The codification of intentions to collaborate in the process of outcome creation is positively related to suppliers' instrumentality. The reward sharing ratio proportional to the value of the individual contribution is positively associated with suppliers' instrumentality.
67.	Nikulina and Wynstra (2022)	<p>Joint collaborative involvement in planning the outcome creation process is positively related to suppliers' expectancy. Commitment to joint collaborative management and control of outcome creation is positively related to suppliers' expectancy. Codification in contracts of the intention to collaborate in the process of outcome creation is positively related to suppliers' expectancy. The technical and managerial reputation of the PBC parties and the buyer positively affects suppliers' expectancy. Conflicting financial reward schemes between individual input-based rewards of PBC parties in case of hybrid PBC are negatively related to suppliers' expectancy.</p>  <pre> graph LR A[Joint outcome planning] -- "+" --> D[Suppliers' expectancy] B[Commitment to joint management] -- "+" --> D C[Codification of intent to collaborate] -- "+" --> D E[Reputation] -- "+" --> D F[Conflicting financial rewards] -- "-" --> D </pre>
68.	Nikulina and Wynstra (2022)	The codification of intentions to collaborate in the process of outcome creation is positively related to suppliers' instrumentality. The reward sharing ratio proportional to the value of the individual contribution is positively associated with suppliers' instrumentality.

		 <pre> graph LR A[Codification of intent to collaborate] -- "+" --> D[Suppliers instrumentality] B[Reward sharing proportional to individual contribution] -- "+" --> D </pre>
69.	Nullmeier et al. (2016)	<p>The greater the extent to which factors beyond the control of buyer or supplier affect service outcomes, the lower the outcome attributability of performance to supplier inputs and effort. The greater the extent to which the buyer assumes the design engineer, production manager, and component supplier roles, the lower the outcome attributability of performance to supplier inputs and effort. The lower the outcome attributability of performance to supplier inputs and effort, the lower the level of supplier inputs and effort. A buyer's effective engagement in monitoring and coordinating activities moderates the relationship between the extent to which the buyer assumes the design engineer, production manager, and component supplier roles and outcome attributability of performance to supplier inputs and effort, such that this negative relationship is attenuated.</p>  <pre> graph LR A[Uncontrollable factors affect service outcomes] -- "-" --> C[Outcome attributability] B[Multi-role buyer] -- "-" --> C C -- "+" --> D[Level of supplier inputs and effort] E[Buyers engagement in monitoring] -- "+" --> BC[] subgraph BC [] B --> C end </pre>

71. Rungtusanatham et al. (2007)

If a supplier is risk-neutral and result-oriented, then a performance-based contract is suitable.

72.	Salehi et al. (2021)	<p>Afghanistan embarked on PBF based on the successful implementation of PBF in Rwanda context. Likewise, PBF was seen as an opportunity to improve the provision of healthcare services rapidly. This finding is in line with other health systems performance studies that the availability of funding was a key factor influencing health policy uptake in LMICs. The MoPH support for PBF adoption was partly linked to their past positive experience of performance-based contracting. The policy process underlying the design and implementation of the PBF programme in Afghanistan was a result of power dynamics and interactions between PBF programme actors. PBF can be successful if actors take on responsibility for the programme. While path dependency can influence policy choice, the capacity of an organisation in implementing a new policy is equally vital. Therefore, it is highly important to ensure adaptability and responsiveness of the PBF programme design to the local context, and the availability of the local capacity to manage the implementation of RBF</p>  <pre> graph LR subgraph Antecedents A1[Path dependency] A2[Unsatisfactory availability ex ante] A3[Availability of funding] end subgraph SuccessFactors [Success factors] S1[Power dynamics and interactions] S2[Institutional capacity] S3[Adaptability] end A1 -- "+" --> PBC[PBC implementation] A2 -- "+" --> PBC A3 -- "+" --> PBC PBC -- "+" --> S1 PBC -- "+" --> S2 PBC -- "+" --> S3 </pre>
73.	Samra et al. 88. Selviaridis and Norrman (2015)

PBC adoption in two of the cases is driven by the need to align incentives and business goals. In contrast, lack of PBC adoption in LLPCo can be partly explained with reference to the differing business logics and conflicting goals between the provider and its key customers. Customer reluctance to offer bonus payments to the service provider appears to create difficulties in adopting PBC. The study confirms that contract design entails challenges related to setting up performance metrics and monitoring systems (Forslund, 2012) and designing incentive payment systems and allocating risk (Whipple and Roh, 2010). The findings also add to existing studies (e.g. Selviaridis and Norrman, 2014) by revealing specific challenges such as the customer relationship management effects of performance monitoring system design.

89. Selviaridis and Norrman (2014)

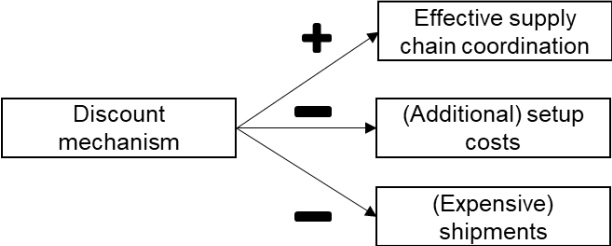

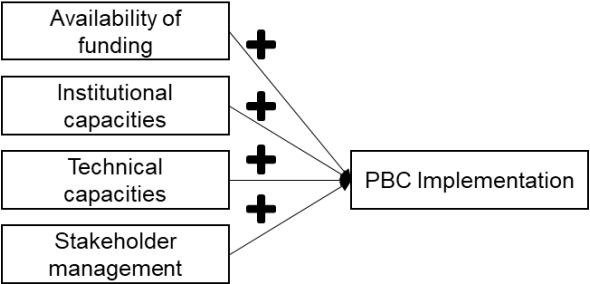

The lower the attributability of performance to service provider input within the service supply chain, the less willing the service provider is to bear increased financial risk by linking its payment to performance achievement. The lower the reliance on relational governance mechanisms in service provider relations with customers and sub-contractors, the less willing the service provider is to bear risk related to performance based payment. The lower the potential for the service provider to balance risks and rewards related to performance in the service supply chain, the less willing the service provider is to bear risk related to linking its payment to service performance achievement. The lower the potential for transferring risk related to performance in the service supply chain to subcontractors, the less willing the service provider is to accept such risk (transferred to by the customer) by directly linking its payment to service performance achievement. Low attributability of performance to service provider input within the service supply chain is likely to mobilize relational governance mechanisms in provider relations with customers and sub-contractors so as to increase provider willingness to bear PBC-induced risk. The lower the potential for the service provider to balance risks and rewards related to performance in the service supply chain, the less able the service provider is to transfer to sub-contractors the financial risk related to PBC.

(2007)	<p>The attractiveness of incentives throughout the entire contract period guarantees suitable motivation throughout the contract's life and minimizes the likelihood of undesirable conduct.</p>  <pre> graph LR CIA[Constant incentive attractiveness] -- "-" --> OB[Opportunistic behaviour] </pre>
100.	Ssenooba et al. (2012)	<p>The lessons for those aiming to implement similar interventions are that PBC should not be attempted ‘on the cheap’, requires a plan to match institutional and technical capacities required of implementers to those that can be marshalled, and requires careful consideration of the likely responses of multiple actors both insiders and outsiders to the intended change process.</p>  <pre> graph LR AF[Availability of funding] -- "+" --> PBC[PBC Implementation] IC[Institutional capacities] -- "+" --> PBC TC[Technical capacities] -- "+" --> PBC SM[Stakeholder management] -- "+" --> PBC </pre>
101.	Stenbeck (2008)	<p>Financial incentives of PBC improves quality without cost increase by decreasing delays about 10% and the number of technical errors about 20% (in contrast to traditional unit-price or cost-plus).</p>

		<pre> graph LR PFP[Pay for performance] -- "+" --> MB[Motivational behaviour] subgraph MB_Box [Motivational behaviour] PPI[Product/process improvement] LTR[Lead time reduction] CR[Cost reduction] end MB_Box -- "+" --> PQ[Performance quality] </pre>
102.	Stenbeck (2008)	<p>The (good) relationship between the contract partners does not suffer from the rise efficiency through PBC, the relationship improves.</p> <pre> graph LR PFP[Pay for performance] -- "+" --> E[Efficiency] E -- "+" --> R[Relationship] </pre>
103.	Sumo et al. (2016)	<p>Our findings suggest that in both cases, the low degree of term specificity in PBCs (i.e., their openness regarding how to render the contracted services) provides suppliers with autonomy in their daily service operations, which in theory allows them to innovate. However, only one of the suppliers exhibited high innovative performance. Other relevant factors aside, our findings further suggest that a lack of granted autonomy during contract execution is an important factor in explaining the level of supplier-led innovation. Our findings imply that outsourcers that remain too closely involved with the outsourced service delivery and do not allow their suppliers to act autonomously during contract execution limit their suppliers' innovation potential.</p> <pre> graph LR LTS[Low term specificity] -- "+" --> SA[Suppliers autonomy in execution] SA -- "+" --> QI[Quality investment] </pre>
104.	Susanti et al. (2019)	<p>PBC contracts generate a lower LCC compared to traditional contracts. The longer the duration of PBC contracts, there is a tendency for the LCC to decline.</p>

		<pre> graph LR PBC[PBC Implementation] -- "+" --> CL[Contract length] PBC -- "+" --> LCC[LCC efficiency] CL -- "+" --> LCC </pre>
105.	Uvet et al. (2022)	<p>Upfront investments in system reliability increases system availability while reducing total service costs. Because with PBC penalty mechanisms the suppliers total costs increase with the penalty costs, that why suppliers invest in better performance to generate high availability rates.</p> <pre> graph LR subgraph Characteristics RPM[Reward/penalty mechanism] end subgraph MB PPI[Product/process improvement] CR[Cost reduction] end RPM --> PFP[Pay for performance] PFP -- "+" --> QI[Quality investment] QI -- "+" --> PPI QI -- "+" --> CR PPI -- "+" --> PQ[Performance quality] CR -- "+" --> PQ </pre>
106.	Uvet et al. (2022)	<p>Financial incentive mechanisms (rewards and penalties), the length of the contract (time-based incentives) and target availability rates (performance measurement) are significant for the supplier's decision to make upfront investments to increase system reliability.</p> <pre> graph LR subgraph Characteristics RPM[Reward/penalty mechanism] LCC[Length of the contract] end subgraph MB PPI[Product/process improvement] end RPM --> PFP[Pay for performance] LCC --> CD[Contract duration & renewal prospects] PMP[Performance measurement (KPI)] -- "+" --> QI[Quality investment] PFP -- "+" --> QI CD -- "+" --> QI QI -- "+" --> PPI </pre>
107.	Uvet et al. (2022)	<p>The availability of the system decreases with an increase in the length of the contract and suppliers are more eager to invest in reliability improvement under longer-term PBC agreements.</p>

		<pre> graph LR A[Characteristics Long-term contract] --> B[Contract duration & renewal prospects] B --> C[Quality investment] B -- - --> D[Performance quality] C -- + --> D C -- + --> E[Product/process improvement] E --- F[Motivational behaviour] </pre>
108.	Uvet et al.
